

Relief Valves (RL4 Series)

Catalog 4131-RL Revised, April 2005

RL4 Series Relief Valve

Introduction

Parker RL4 Relief Valves are designed such that when the upstream pressure exceeds the closing force exerted by the spring, the lower stem opens, permitting flow through the valve. Flow through the valve increases proportionately to the increase in upstream pressure.

Features

- Pressure settings are externally adjustable while the valve is in operation. Seven different spring ranges provide greater system sensitivity and enhanced performance.
- Manual override option with positive stem retraction is available for the full working pressures range. This option permits the user to relieve upstream pressure while maintaining the predetermined cracking pressure.
- Color coded springs and labels indicate spring cracking range.
- Back pressure has minimum effect on cracking pressure.
- Lock wire feature secures a given pressure setting.

Available End Connections

Z - Single ferrule CPITM compression port

M - ANSI/ASME B1.20.1, External pipe threads

KM - British Standard BS21 (ISO 7-1), External pipe threads
